

SteelCentral Portal

A Centralized, Dynamic View of Application Performance

Riverbed® SteelCentral™ Portal redefines how companies visualize, monitor, report, and troubleshoot application performance by combining user experience, application, and network data into a centralized, dynamic solution. This holistic view gives operational teams a single source of truth for application performance, keeping key resources focused on strategic projects—accelerating troubleshooting, and providing meaningful data for stakeholders throughout the enterprise. The solution builds on Riverbed’s strong legacy of providing end-to-end visibility across the network and application, from server to end-user. SteelCentral Portal brings visibility into and control over end-user experience, application performance, and network performance together in one easy-to-use collaborative solution. By blending data from industry leading tools including SteelCentral AppInternals, AppResponse, NetAuditor, NetProfiler and NetSensor APM and NPM data, only Riverbed creates a dynamic map of application performance. Different teams are able to get a complete picture of the application environment. Instead of wasting valuable time and resources assessing blame, you can rapidly diagnose and fix service issues before end users notice. SteelCentral Portal also makes it easier to communicate application status and performance, as well as show SLAs in a way that non-IT stakeholders can understand. Portal gives you a central way to regularly communicate the value IT is bringing to the enterprise, instead of executives only hearing from IT when there is a problem.

Key Benefits

Resolve application performance issues with actionable intelligence SteelCentral Portal is the only IT performance management solution that can display deep user experience, application, network, infrastructure and server performance

data in a central view supported by a comprehensive set of data source tools. This enables disparate IT performance management teams to efficiently use resources to more rapidly resolve operational issues that impact application performance and, over time, to proactively avoid service issues. IT organizations can arrive at a common set of metrics to collect and report on for each application, then standardize on a common view on how to present the application performance data, despite the different platforms each application may be running on, or whether the app traffic is optimized or non-optimized (based on data supplied by SteelHead).

Significantly Reduce Time for Set Up and Reporting

SteelCentral Portal’s wizard-driven application discovery reduces the time to build a monitoring and reporting framework and deliver performance reports. Rather than relying on an administrator’s knowledge of the environment, the Portal’s application model offers a dynamic, application infrastructure service map that includes all related components: servers involved, network hops, and data needed for delivering the applications. In addition, adaptive workflows provide guidance to available reporting metrics and “best” options depending on the connected data sources, automatically updating available views as new data sources are added.

Provide Stakeholders Throughout the Enterprise with Meaningful Data

SteelCentral Portal offers each stakeholder a role-based home page that prioritizes the information that is most important to that user. You can include custom dashboards and default dashboards tailored to the individual’s needs. For example, e-commerce site

About Riverbed

Riverbed, at more than \$1 billion in annual revenue, is the leader in application performance infrastructure, delivering the most complete platform for the hybrid enterprise to ensure applications perform as expected, data is always available when needed, and performance issues can be

proactively detected and resolved before impacting business performance. Riverbed enables hybrid enterprises to transform application performance into a competitive advantage by maximizing employee productivity and leveraging IT to create new forms of operational agility.

Riverbed’s 27,000+ customers include 97% of the Fortune 100 and 98% of the Forbes Global 100.

Integrio Technologies, an SBA-designated small business headquartered in Herndon, Va., is an IT integration and engineering company that offers reliable, cost-effective, secure solutions for organizations seeking to develop new capabilities and optimize legacy systems. Our company collaborates with its customers, partners and employees to provide outstanding cutting-edge solutions for network performance, secure wireless infrastructure, software application lifecycle support, and physical cyber security that support the missions of federal, state and local government agencies.

owners can see current shopping volume for business patterns, or network managers can see relevant performance information. For each role, SteelCentral Portal provides all the needed information in a single screen, one dashboard at a time, with one-click access to the most common dashboard editing tasks.

Optimize Performance with SteelHead Integration

With your SteelHead integrated with SteelCentral AppResponse and NetProfiler, you are able to look across your network and view both non-optimized and optimized traffic. Regardless of whether the data resides in the data center, branch, or in the cloud, Portal produces actionable performance visibility for all your mission critical applications, ultimately allowing IT to optimize with SteelHead.

Key Features

Graphical Application Discovery

SteelCentral Portal's Application Discovery takes an interactive, wizard-driven process to help you discover and build a service model for your operational environment. As a result, you are able to reduce the amount of time and effort needed to develop and implement a reporting framework.

Data-driven Metric Guidance

SteelCentral Portal includes powerful, out of the box workflows that assist administrators to select the "best" metrics based on available data sources. Administrators determine the information needed and Portal automatically curates different workflows based on available data sources.

Efficient Management Reporting

Portal gives you a central source of truth for application performance and supporting infrastructure. Looking at the same triage data fosters better teamwork helping you rapidly diagnose the issue's root cause. In addition, and you can readily present meaningful data to stakeholders. This enables IT organizations to arrive at a common set of metrics to collect and report on for each application, then standardize on a common view on how to present the application performance data. Collecting raw

data from the other tool sets across the application model also provides flexibility in reporting, so you can answer a wide variety of performance questions as they arise, despite the different platforms each application may be running on.

AppNetwork Path

SteelCentral Portal enables users to view the network path that an application segment traverses. This provides a unique view of the network infrastructure in addition to network performance, end-user experience, and application performance monitoring views, helping them to troubleshoot application problems more quickly.

Relevant Stakeholder Views

Portal offers each stakeholder a role-based home page that prioritizes the information that is most important to that user. You can include custom dashboards and default dashboards tailored to the individual's needs. For example, e-commerce site owners can see current shopping volume for business patterns, or network managers can see relevant performance information. For each role, Portal gives you all the information you need in a single screen, one dashboard at a time, with one-click access to the most common dashboard editing tasks.
